## DOORBUS FTZ

Universal adapter with  
telephone line interface  
for the connection of door station  
with FTZ 123 D12 interface  
and PA systems to a PBX

---

 **ROCOM**

## Description

The universal adapter **DOORBUS FTZ** allows the connection of door speakers with FTZ 123 D12 interface and PA amplifier to a PBX using a standard analogue telephone extension line. The unit takes place in a plastic casing which can be installed on a standard DIN bar.

The connection to the door speaker is done using the standard interface FTZ 123 D12, typically by connecting the device to the adapter amplifier of the door station manufacturer. The following connections are available: TÖ1/TÖ1' to connect the electrical door opener (max. 40 Vac/2 A), TÖ2/TÖ2' for the optional connection of a second electrical door opener (max. 40 Vac/2 A, an optional relay must be installed inside the device), TS/TS' driver contact to switch the amplifier on/off, NF/NF' 2 wires speech connection to the amplifier. The door speaker and the amplifier must be separately powered. The volume for microphone and loudspeaker can be adjusted. As for the speech line a galvanic separation is provided more than one **DOORBUS FTZ** can be connected to the same PBX.

For the connection of PA amplifiers the NF/NF' output is connected to a microphone or AUX input of the amplifier. The sending volume and the impedance can be adjusted using the specific controller. The TS/TS' driver contact is used to activate the amplifier (i.e. on/off switching). As alternative also the contact TÖ1/TÖ1' can be used. For this second contact a delay for the switch on of the amplifier can be programmed to avoid noises on the loudspeaker of the PA system. With the optional second contact TÖ2/TÖ2' a PA zone selection can be arranged. If the amplifier is driven using the contact TS/TS'(no delay programmable) the TÖ contacts 1 and 2 (optional) can be used to control up to two different paging zones. For PA systems with speech back function also the microphone direction can be switched on and off.

**The DOORBUS FTZ itself is completely powered from the telephone line. Please note that the red LED is switched on only during the line seizure.**

The device is activated using a door chime button. For the button a up to 16 digits long telephone number can be programmed. The chime bell button must have a dry contact.

With the PBX the **DOORBUS FTZ** adapter is connected using two wires to an analogue telephone extension line. If the chime button is activated the line will be seized, the red LED will go on and the stored telephone number is dialled using DTMF tones. The telephone number is stored using DTMF dial. The digits 0 to 9, \*, # can be part of the telephone number. Using the same procedure also all other programming steps are done. The programming mode activation is protected by a programmable password. Only the selection of the hardware timer duration and the disabling of the automatic answer function are not supported using the DTMF programming procedure. Those functions are selected using jumpers inside the

If needed, and when used as an interface to a PA amplifier, the **DOORBUS FTZ** can

also be called. With the detection of the first ringing signal the unit will automatically answer the call and set up the connection. After the call answer the unit will send an acknowledgement tone. For this tone the programmed telephone number is used. If no number has been programmed, no tone will be send.

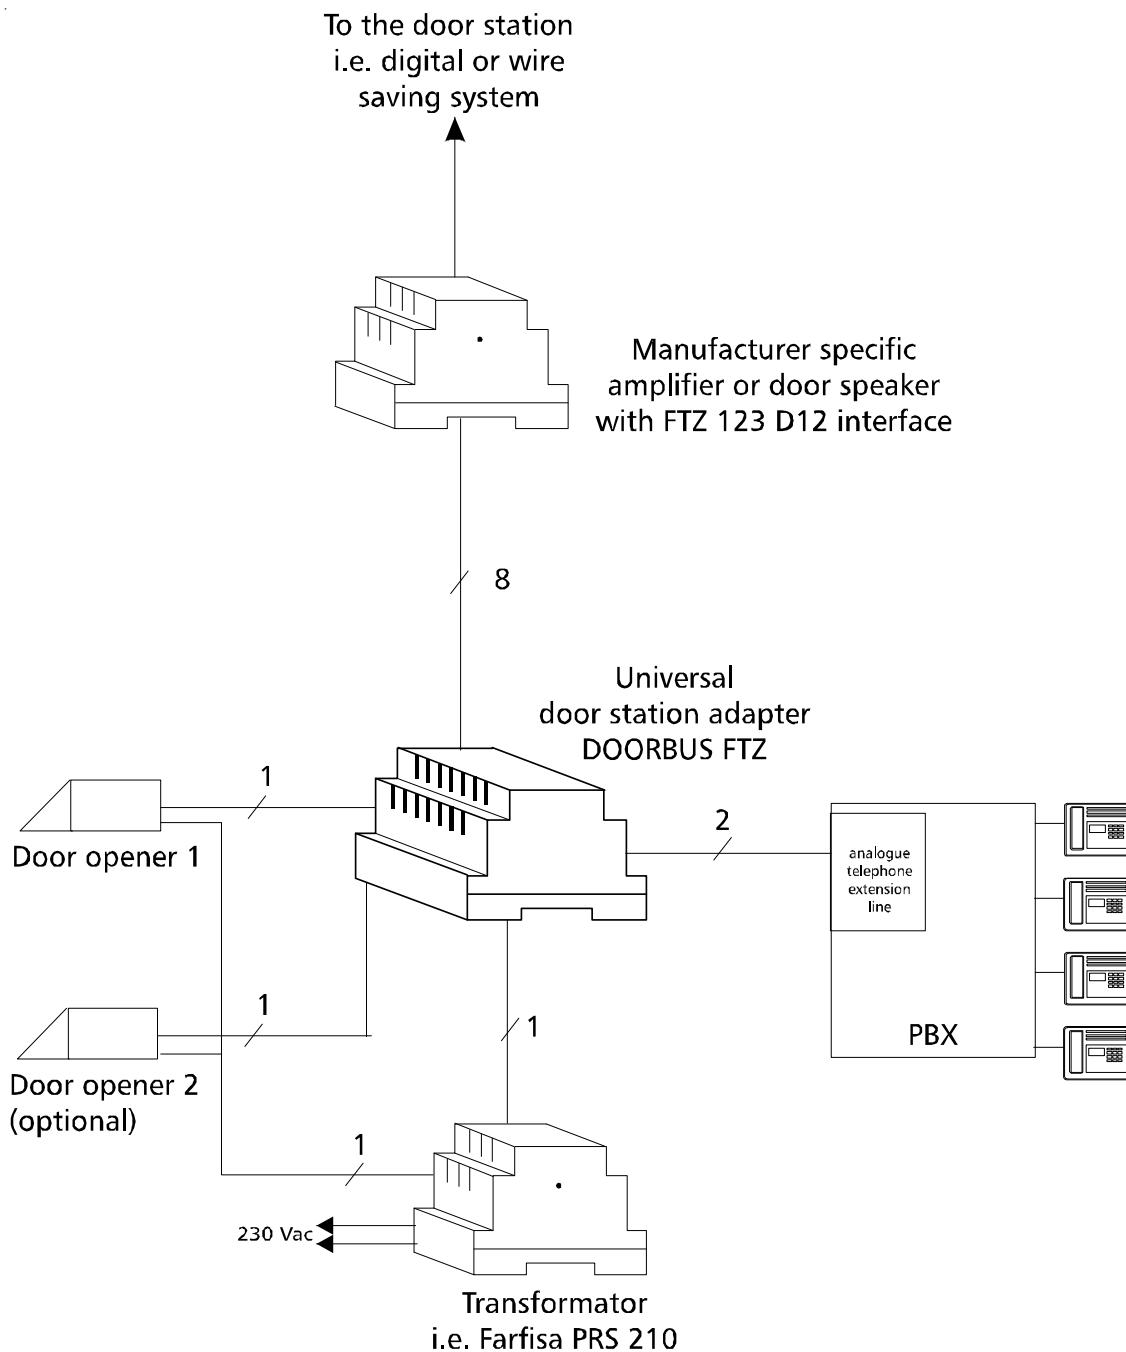

During the connection the user can dial DTMF tones to activate some functions. Dialling the digit 7 will activate the driver contact TÖ1 and the digit 8 the optional driver contact TÖ2. Those are activate for the programmed activation time. If the automatic disconnection after driver contact activation is disabled, the user can repeat this operation more times. Furthermore the microphone of the door speaker can be disabled using the digit 1.

The connection is automatically terminated if the device will detect a busy tone. Also using the DTMF digit 3 the user can disconnect the DOORBUS FTZ adapter manually without opening the door. If the called party doesn't answer within 7 calls the line will be trunkated. For the enhanced security there is also a selectable hardware time. It will ensure that the connection is terminated after a selectable time of 1,2 or 4 minutes whatever status the device has.

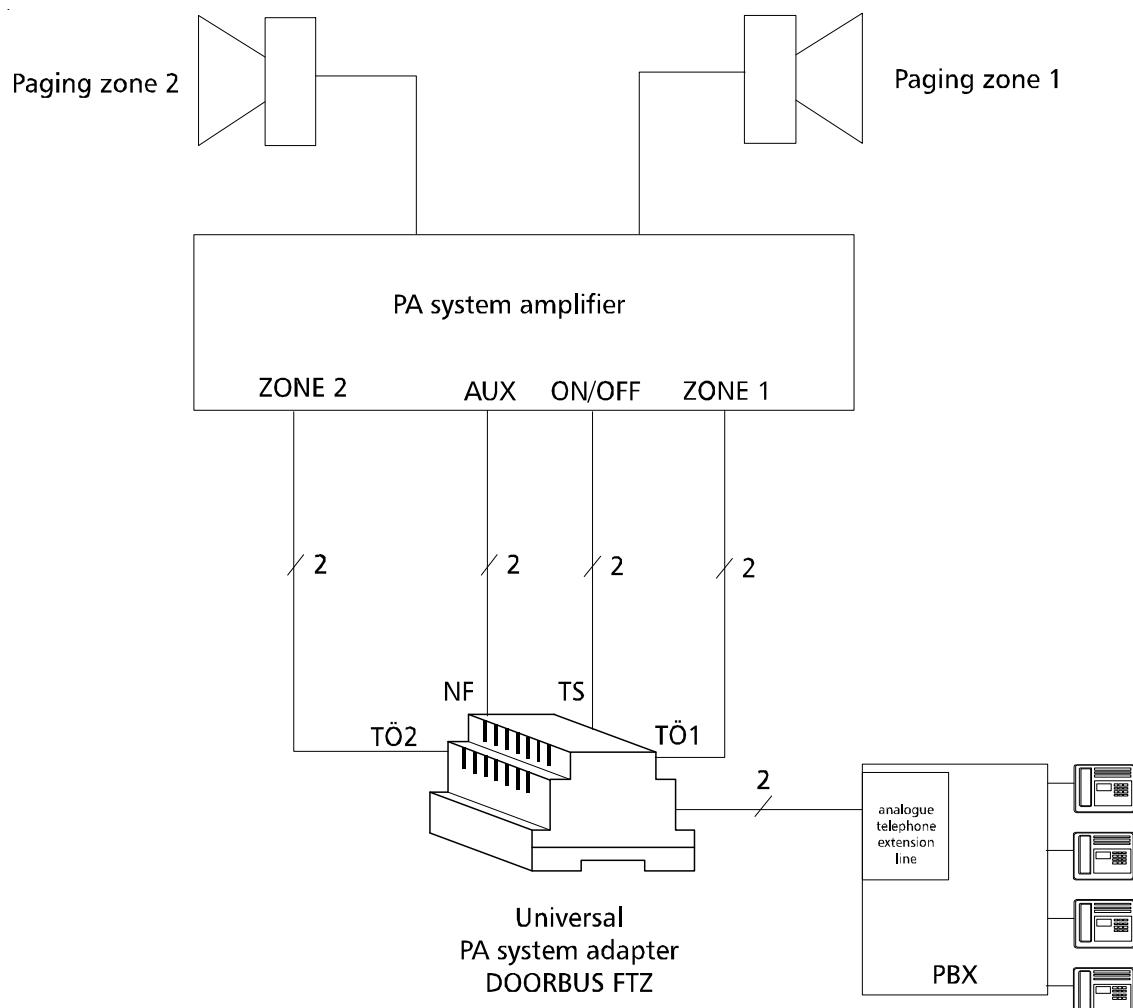

## Features

- One dry contact bell chime button can be connected. One 1 to 16 digits (0-9,\*,#) long telephone number can be programmed
- Programming using DTMF dial tones with password protected access
- Programmable door opener activation time (0 to 9 s)
- Programmable number of call rings 1 to 99
- Automatic call answer (selectable)
- State-of-the-art handsfree speakerphone functionality
- Busy tone detection
- Volume adjustment for microphone and loudspeaker
- Microphone on/off switch using DTMF dial tone
- Adjustable impedance for amplifier/door speaker unit
- Driver contacts activated by DTMS dial tones (door opener function)
- Up to two driver contacts for PA zone selection
- Driver contact with programmable on/off delay
- Optional second driver contact
- Line seizure termination using DTMF dial digit
- DTMF dial from outside disabled
- Connection to any PBX using a standard analogue telephone line, only two wires
- DTMF dial
- Hardware call termination timer (selectable)
- External line busy indicator (LED) can be connected

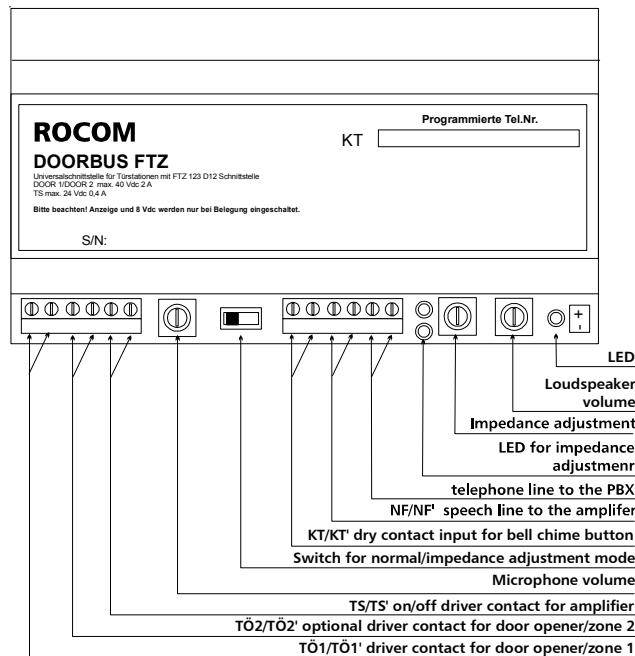

## Connection overview - FTZ 123 D12 door station

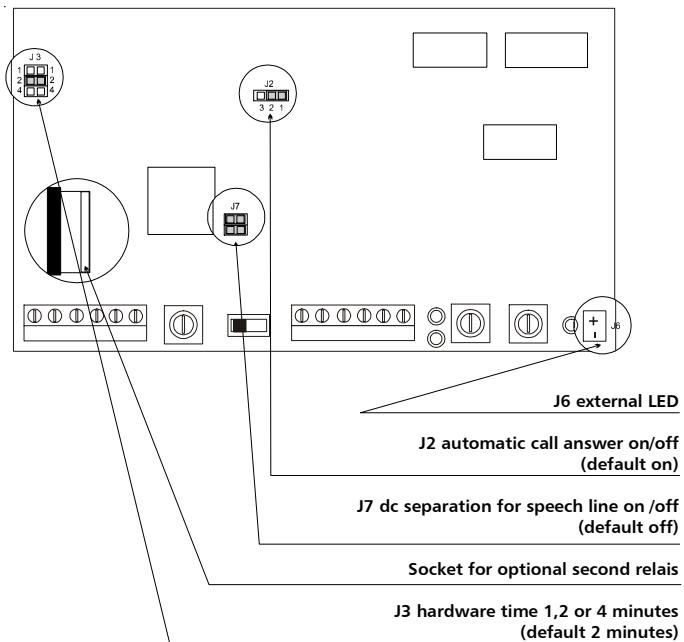

## Connection overview - PA system amplifier

## Overview - connectors

## Overview - internal jumpers

## Installation

The **DOORBUS FTZ** device has been planned for the installation inside a cabinet on a standard DIN bar (9 DIN A modules).

Before installing the device please ensure that after taking it out from the package there are no visible damages. With a light shaking please also ensure that none of the internal jumpers has been removed during the transportation. If this is the case you can proof the default setting using the overview in the previous page.

### Please read the following indications!

The installation side of the device should be:

- in a dry room;
- far from dirt, heat and direct sun light;
- far from device generating strong electromagnetical fields (like loudspeaker);
- far from liquids and chemical aggressive substances.

Before you start with the installation please note:

- The device can be powered only with voltage indicated on the identification label.
- The device doesn't contain maintainable parts and should be opened only by instructed technicians.
- If a liquid should get into the device disconnect immediately the power supply. The device should be opened only by instructed technicians.
- To polish the device use only a clean and soft cloth. To remove spots use a umid cloth or a natural cleaning substance. Do not use chemical substances or petrol, these might damage the plastic of the case.
- Do not drop or shock the device.
- Static discharge may damage the device. Ensure that you discharge yourself using a appropriate grounding before handling the unit.

After the installation and cabling, as indicated in the next pages, the devices has to be programmed. For this you need a telephone able to send DTMF dial tones. Further the internal jumper J2 for the automatic call answer must be inserted, as by default. Now you have to call the device using the phone and the telephone number of the extension line where the device has been connected to. The following programmations can be performed:

- programmation and change of the telephone number;
- number of calls;
- automatic line disconnection after driver contact activation on/off;
- activation time for driver contact 1 and 2;
- manual or automatic microphone activation after call set up;
- manual or automatic, time controlled activation of driver contact 1;

- default data load;
- programming or change the password.

After programming you can set the functions automatic answer (jumper J2, default on) and the hardware timer (jumper J3, default 2 minutes) as required. To change this settings you have to open the device. Use herefor a small screwdriver and press carefully the closing nipples on the bottom of the device casing to the outside. After change of the jumper setting close the case again.

The **DOORBUS FTZ** is now ready to be used. Set up now a connection between PBX and door station as described later on. **You now have to adjust the speech line impedance.** Operate the switch **DEV1**. A test tone can be heard at the door station and the phone. **Please ensure that there is enough distance between phone and door station to avoid larsen effects!** Use now the potentiometer PT3 until both LEDs LD3 and LD2 are off or will light alternatively. After this adjust the volumes as required. You can use the controller on the **DOORBUS FTZ** itself, at the door speaker or on the connected amplifier. Please be sure to regulate carefully.

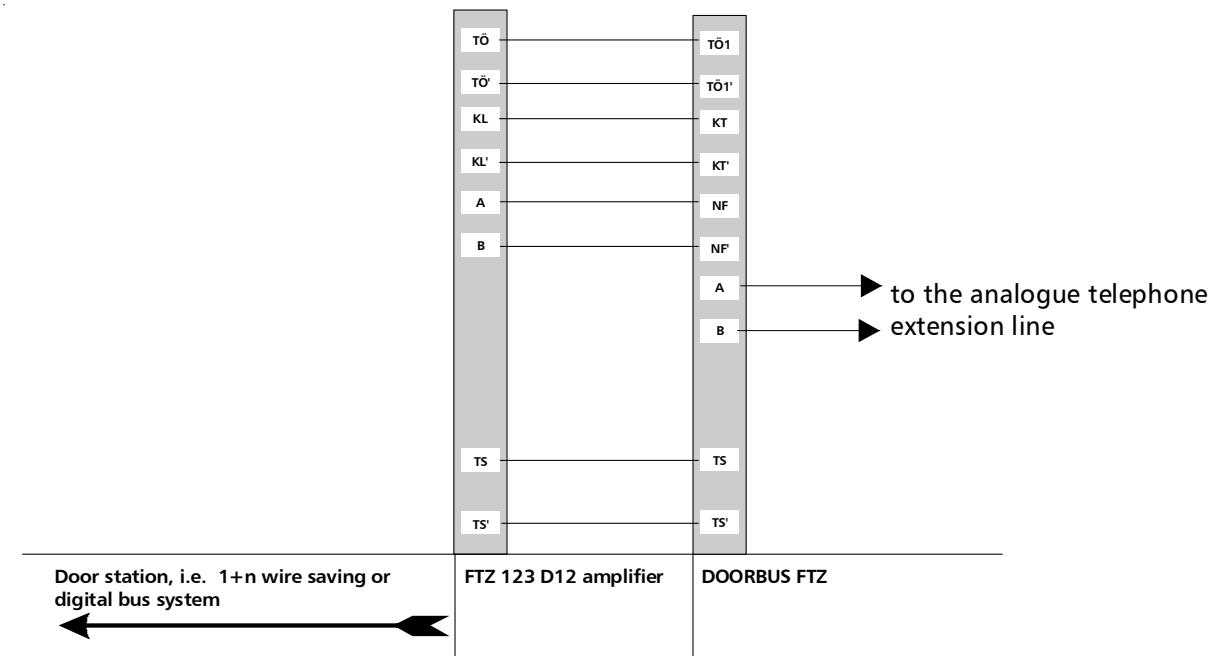

**With very noisy external environment it can happen that the device is not able to recognize the busy tone.** In this case use always the digit 3 to terminate the call manually.

Please note that only **1 door opener with 40 Vpp 2 A** can be connected to each driver contact. If you need to connect more door opener or you need a higher current, an external relay, i.e. the universal relay 1471E, must be used.

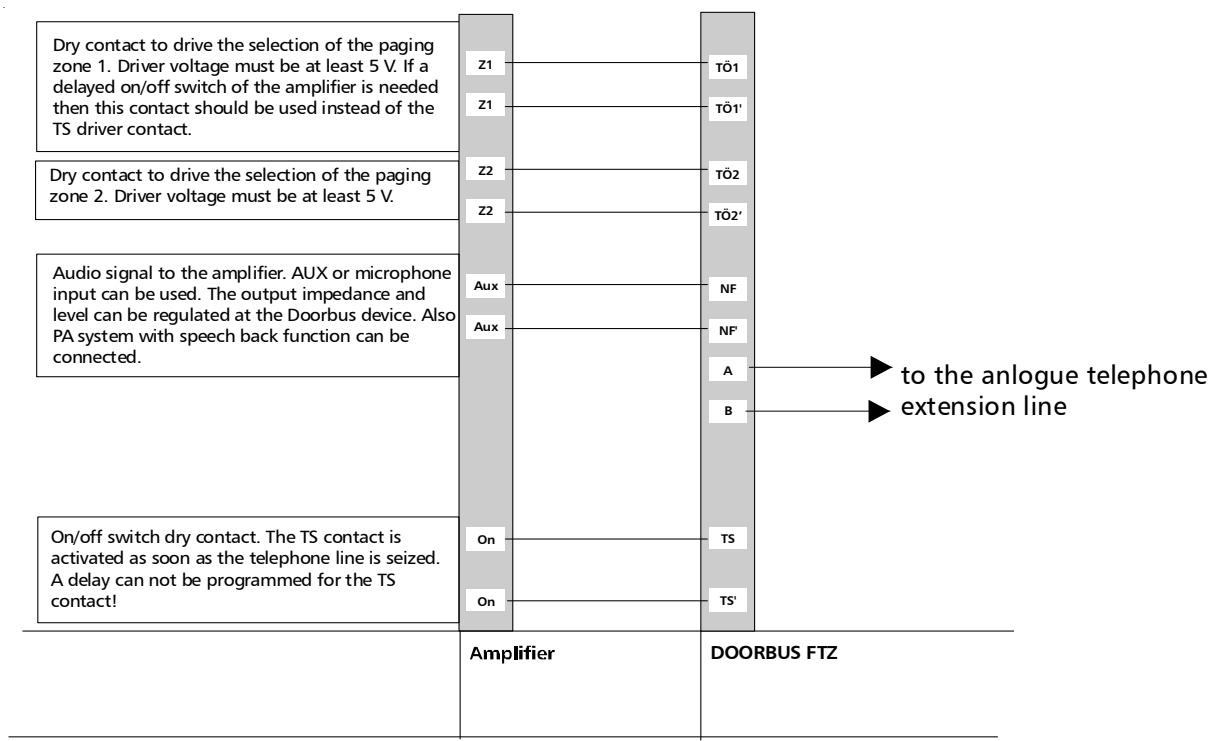

Please note the following connecting the device to a PBX:

- The **DOORBUS FTZ** adapter is a fixed installation and is not provided with a modular cable connection.
- If connecting to a PBX with digital phones, like ISDN terminal equipment, ensure that they are able to send DTMF dial tones, as this is required to open the door and other functions.

## Connection plan - FTZ 123 D12 amplifier

## Connection plan - paging system amplifier

## Activate the programming mode

- 1) Dial using a DTMF phone the **extension number** where the DOORBUS FTZ is connected to
- 2) The DOORBUS FTZ will answer the call and send an **acknowledge tone** (the lenght of the tone depends from the programmed telephone number)
- 3) Dial now the code \* # 0
- 3) Wait for a **acknowledge tone**
- 4) Dial now [programmed password]
- 5) Wait for a **acknowledge tone**
- 6) The **programming mode** is now activ.
- 7) Dial the digit 3, to terminate the **programming mode**

### Please note:

- As default the password "1234" ist set.
- If you lose the password there is the possibility to upload the default data using a special procedure. Ask herefore your customer support.
- It is also possible to activate the programming mode without a password (see also password programming). In this case the programming mode will be activated just after the input of the \*#0 code.

## Programming the telephone number

- 1) Activate the programming mode.
  - 2) Dial now the code \* # 1
  - 3) Wait for a **acknowledge tone**
  - 4) Dial now [telephone number max. 16 digits (1 bis 0, \*, #)] \*\*
  - 5) Wait for a **acknowledge tone**
  - 6) Dial the digit 3, to terminate the **programming mode**
- or
- 7) You can dial the **code** for an **other programmation**

### Please note:

- As default ther is no number programmed.
- The special digits \* and # can be used only for the first digit.
- The storing of the \*\* special dial ist NOT possible.

## Programming the number of calls

- 1) Activate the programming mode.
- 2) Dial now the code \* # 2
- 3) Wait for a acknowledge tone
- 4) Dial now [the desired number of calls (00 to 99)]. Programming the value 00 the calls will be not counted. The connection is then terminated only using the hardware timer.
- 5) Wait for a acknowledge tone
- 6) Dial the digit 3, to terminate the programming mode  
**or**
- 7) You can dial the code for an other programmation

### Please note:

- As default the value 07 is programmed.
- The device will terminate the call when the programmed number of calls is reached and the call was not answered.

## Programming the automatic call termination

- 1) Activate the programming mode.
- 2) Dial now the code \* # 3
- 3) Wait for a acknowledge tone
- 4) Dial now [1 if the connection must be automatically terminated after the activation of a driver contact] or [0 if the connection should not be automatically terminated after the activation of a driver contact].
- 5) Wait for a acknowledge tone
- 6) Dial the digit 3, to terminate the programming mode  
**or**
- 7) You can dial the code for an other programmation

### Please note:

- As default the value 1 is programmed.
- If the automatic call termination is active the line will be trunked as soon as one of the two driver contacts 1 and 2 will be activated at the end of the programmed activation time.
- If the driver contact 1 is programmed for automatic activation, the digit "7" will be ignored. With active automatic call termination active after the dial of the digit "8" the driver contact 2 will be activated for the programmed time, after it the driver contact 1 will be opened and after the programmed delay the line will be closed.

## Programming the manual microphone control

- 1) Activate the programming mode.
- 2) Dial now the code \* # 5
- 3) Wait for a acknowledge tone
- 4) Dial now [0 if the microphon must be switched on with the line seizure] or [1 if the microphone must be switched on manually after call answer].
- 5) Wait for a acknowledge tone
- 6) Dial the digit 3, to terminate the programming mode  
or
- 7) You can dial the code for an other programmation

**Please note:**

- As default the value 0 is programmed.
- With manual activation the microphone will be off at the cal answer. The device can be used only to send speech to the loudspeaker. Dialling the digit "1" the microphone will be activated.

## Programming the activation time for driver contact 1 and 2

- 1) Activate the programming mode.
- 2) Dial now the code \* # 7
- 3) Wait for a acknowledge tone
- 4) Dial now [the desired activation time in seconds (1 to 9)]. Programming the value 0 both driver contacts will be disabled.
- 5) Wait for a acknowledge tone
- 6) Dial the digit 3, to terminate the programming mode  
or
- 7) You can dial the code for an other programmation

**Please note:**

- As default the value 5 is programmed.
- The activation time is the same for both contacts (the driver contact 2 is optional).

## Programming the automatic activation of driver contact 1

- 1) Activate the programming mode.
- 2) Dial now the code \* # 8
- 3) Wait for a acknowledge tone
- 4) Dial now [0 if the driver contact 1 is activated manually] or [1 if the driver contact 1 will be activated automatically + the delay time on activation in seconds (0 to 9) + the delay time on deactivation in seconds (0 to 9)]. Programming the delay times with 0 will disable the delay.
- 5) Wait for a acknowledge tone
- 6) Dial the digit 3, to terminate the programming mode  
**or**
- 7) You can dial the code for an other programmation

### Please note:

- As default the value 0 is programmed.
- With manual activation the driver contact 1 (TÖ1) will be activated dialling the digit "7" for the programmed activation time
- With automatic activation te driver contact 1(TÖ1) will be automatically activated with the line seizure. If a activation delay is programmed the contact is switched on with this delay in seconds. If a deactivation delay is programmed the contact is switched off and the line will be disconnected after this delay in seconds (i.e. after digit "3", busy tone

detection, etc.). Example: programming the value \*#8155 the driver contact will be activated with 5 s delay after line seizure (i.e. answering an incoming call). At the detection of a call termination request (i.e. detection of the digit "3" or a busy tone) the device will deactivate at once the driver contact 1 but the line will be closed after a delay of 5 s.

## Programming the password

- 1) Activate the programming mode.
- 2) Dial now the code \* # 4
- 3) Wait for a acknowledge tone
- 4) Dial now [new password 1 to 4 digits long (only the digits 0 to 9 can be used)] \*\*[repeat the new password 1 to 4 digits long (only the digits 0 to 9 can be used)] \*\*
- 5) Wait for a acknowledge tone
- 6) Dial the digit 3, to terminate the programming mode  
or
- 7) You can dial the code for an other programmation

### Please note:

- As default the value "1234" is programmed.
- The special digits \* and # can not be used.
- Programming the value "0" the password function will be disabled.

## Programming the default data

- 1) Activate the programming mode.
- 2) Dial now the code \* # 999
- 3) Wait for a acknowledge tone
- 4) The default data will be loaded
- 5) Dial the digit 3, to terminate the programming mode
- or
- 6) You can dial the code for an other programmation

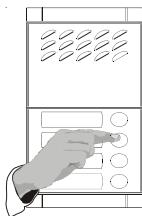

### Please note:

- The programmed telephone number will be also deleted.
- If you lose the password there is the possibility to upload the default data using a special procedure. Ask herefore your customer support.

## How to use

### Call from outside

- The visitor activates the **chime bell button**
- The telephone line will be seized and the stored number dialled

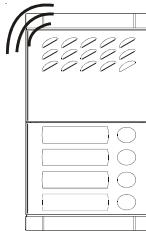

- The extension **will be called**

- At the door station the visitor will hear a **ringing tone**
- If the called party doesn't answer within 7 calls, the call will be terminated
- As soon as the called party **answers** the call he can **talk with the visitor**
- At the end fo the call **dial the digit 7 (TÖ1) or 8 (TÖ2, optional)** to open the door. The driver contact ist activated for 5 s. or
- At the end fo the call **dial the digit 3** to terminate the call without opening the door.
- **Go on hook.**

### Call from outside

- You want to set up a call with the door station or your PA system.
- **Go off hook and dial the extension number** of the door station or PA amplifier.

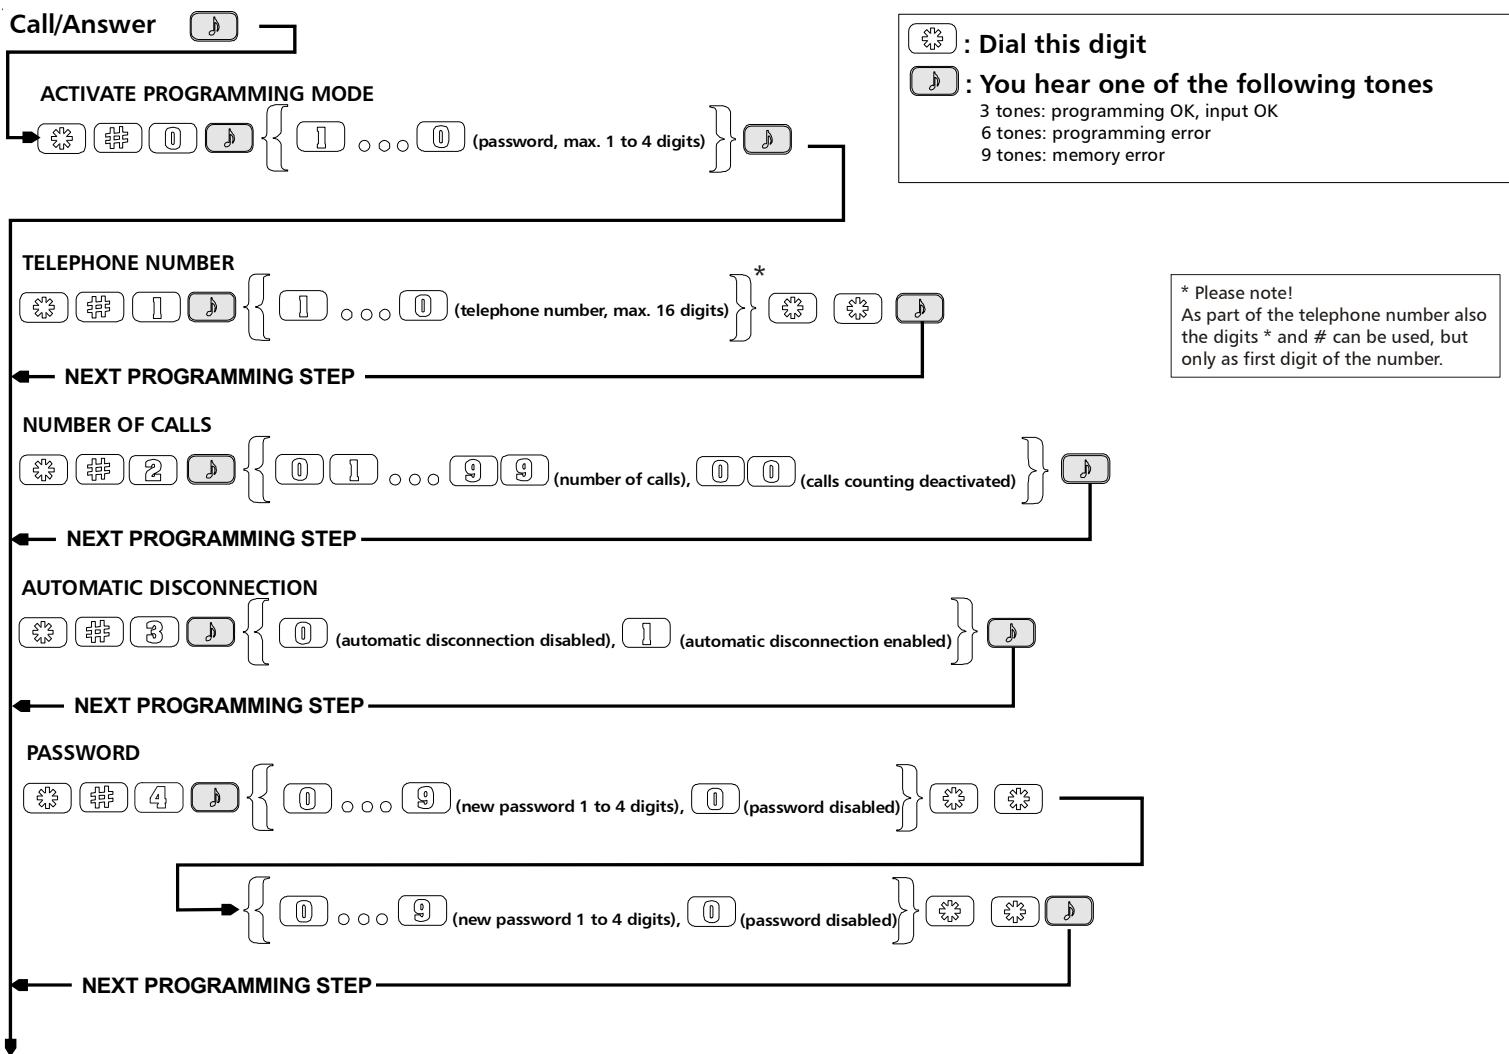

- The door station or PA amplifier will **answer the call automatically**.
- The audio to your door station or PA system is now active and you can **talk to your visitor or make an annoucement**.
- At the end fo the call **dial the digit 7 (TÖ1) or 8 (TÖ2, optional)** to open the door. The driver contact ist activated for 5 s. or **(in any case with a PA system!)**
- At the end fo the call **dial the digit 3** to terminate the call without opening the door.
- **Go on hook.**

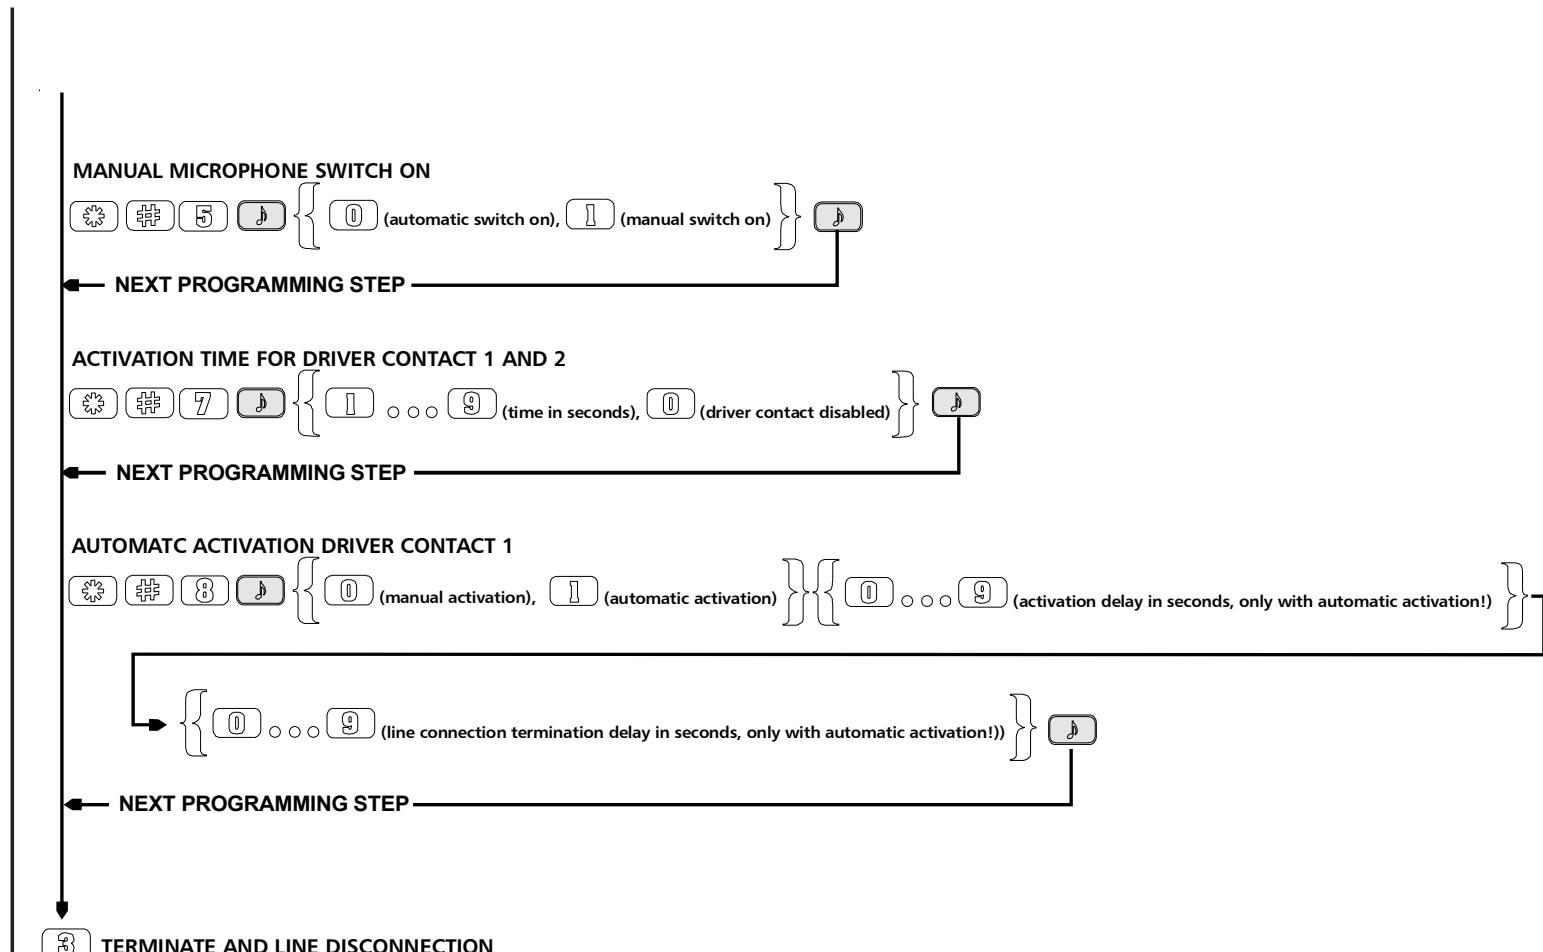

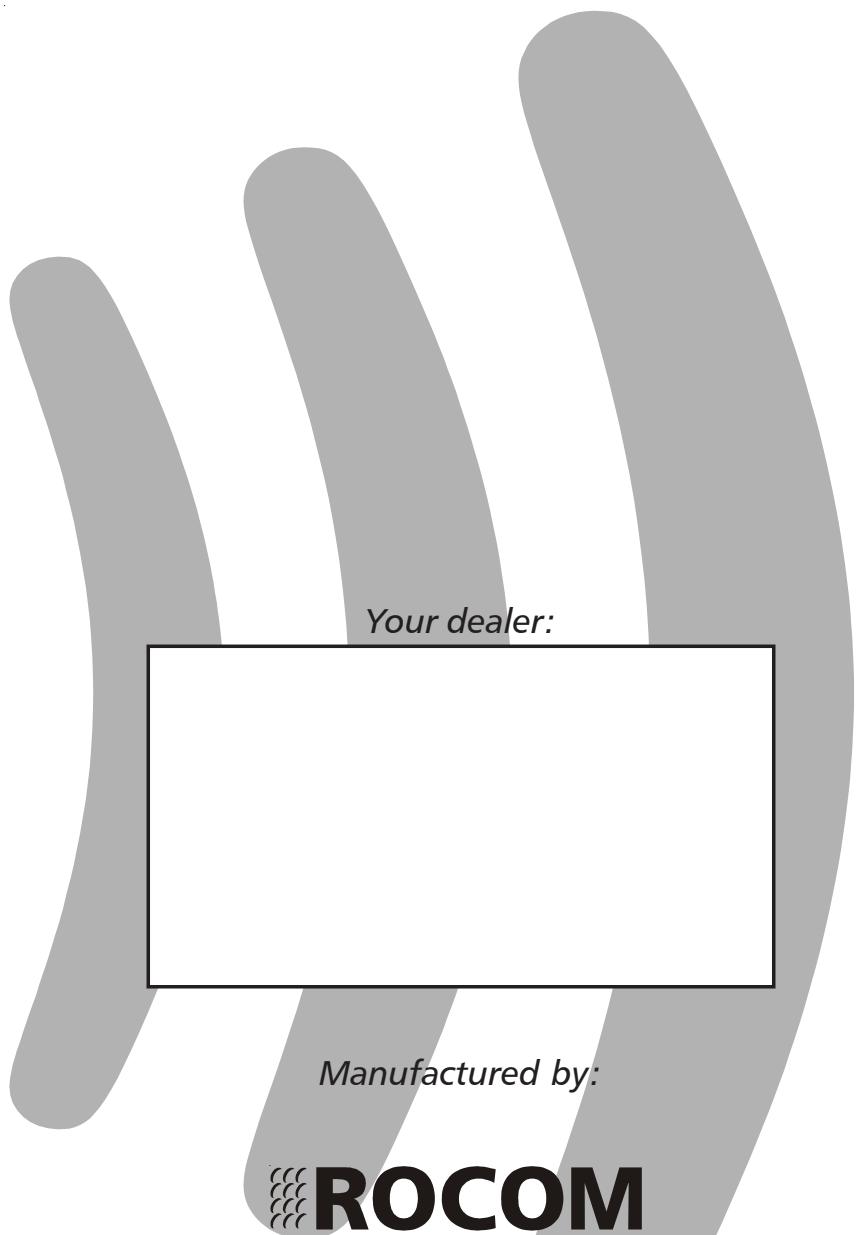

## Technical data

<b>Power supply</b>	over the telephone line
<b>Standby voltage on telephone line</b>	min. 24 Vdc, max. 60 Vdc
<b>Drop voltage at line seizure</b>	10 V +/- 5% at 25 mA
<b>Consumption</b>	Online: min. 0 mA Stand-By: 2 µA
<b>Telephone line impedance</b>	600 Ohm
<b>Dial</b>	DTMF
<b>DTMF dial</b>	DTMF standard Make: 70 ms Break: 70 ms
<b>Tone detection</b>	Frequency: 390 to 480 Hz Ringback tone: Make 770 to 1100 ms Call termination after 1 to 99 tones (programmable)
	Busy tone long: Make 170 to 550 ms. Call termination after 5/6 tones
	Busy tone short: Make 70 to 150 ms. Call termination after 10/11 tones
<b>Driver contacts</b>	Driver 1: DTMF digit "7" Driver 2: DTMF digit "8" (optional) Min. DTMF tone duration: 45 to 50 ms Max. contact load driver 1 and 2: 40 Vpp, 2 A Activation time: 1 to 9 s programmable 1, 2 or 4 minutes selectable
<b>Max. seizure timer</b>	0° to 45° C
<b>Operating temperature</b>	EN 60555-2
<b>EMC</b>	EN 55022 EN 50082-1
<b>Security</b>	EN 60950
<b>Dimensions</b>	158 x 89 x 57 mm (l x h x d) 9 DIN A modul
